Discussion

- Is there an upper limit in the metallicity?
- Whatever value is reachable?
- Different limits for different things? (environments)
- Observational tests for measuring positive feedback (SSCs size).
- Mixing time depends on the conditions...SSCs (pos. F) may be a case of "sudennt me(i)xing"
- Can we calibrate the abubdances of HII regions?
- How realistic is the instant Burts approach is?
- LG data are consistent with the CDM hierachical models?
